2.2 Ac Line Power Supply Rating Changes

The MS610B/J/J1 has a power transformer with several taps so that nominal ac line voltages specified from 100 to 254 Vac can be used.

When changing to a different nominal ac line voltage, change the wiring on the appropriate primary taps of the power transformer according to Fig. 2-12.

(Refer to the circuit diagram **24** in Section 4.)

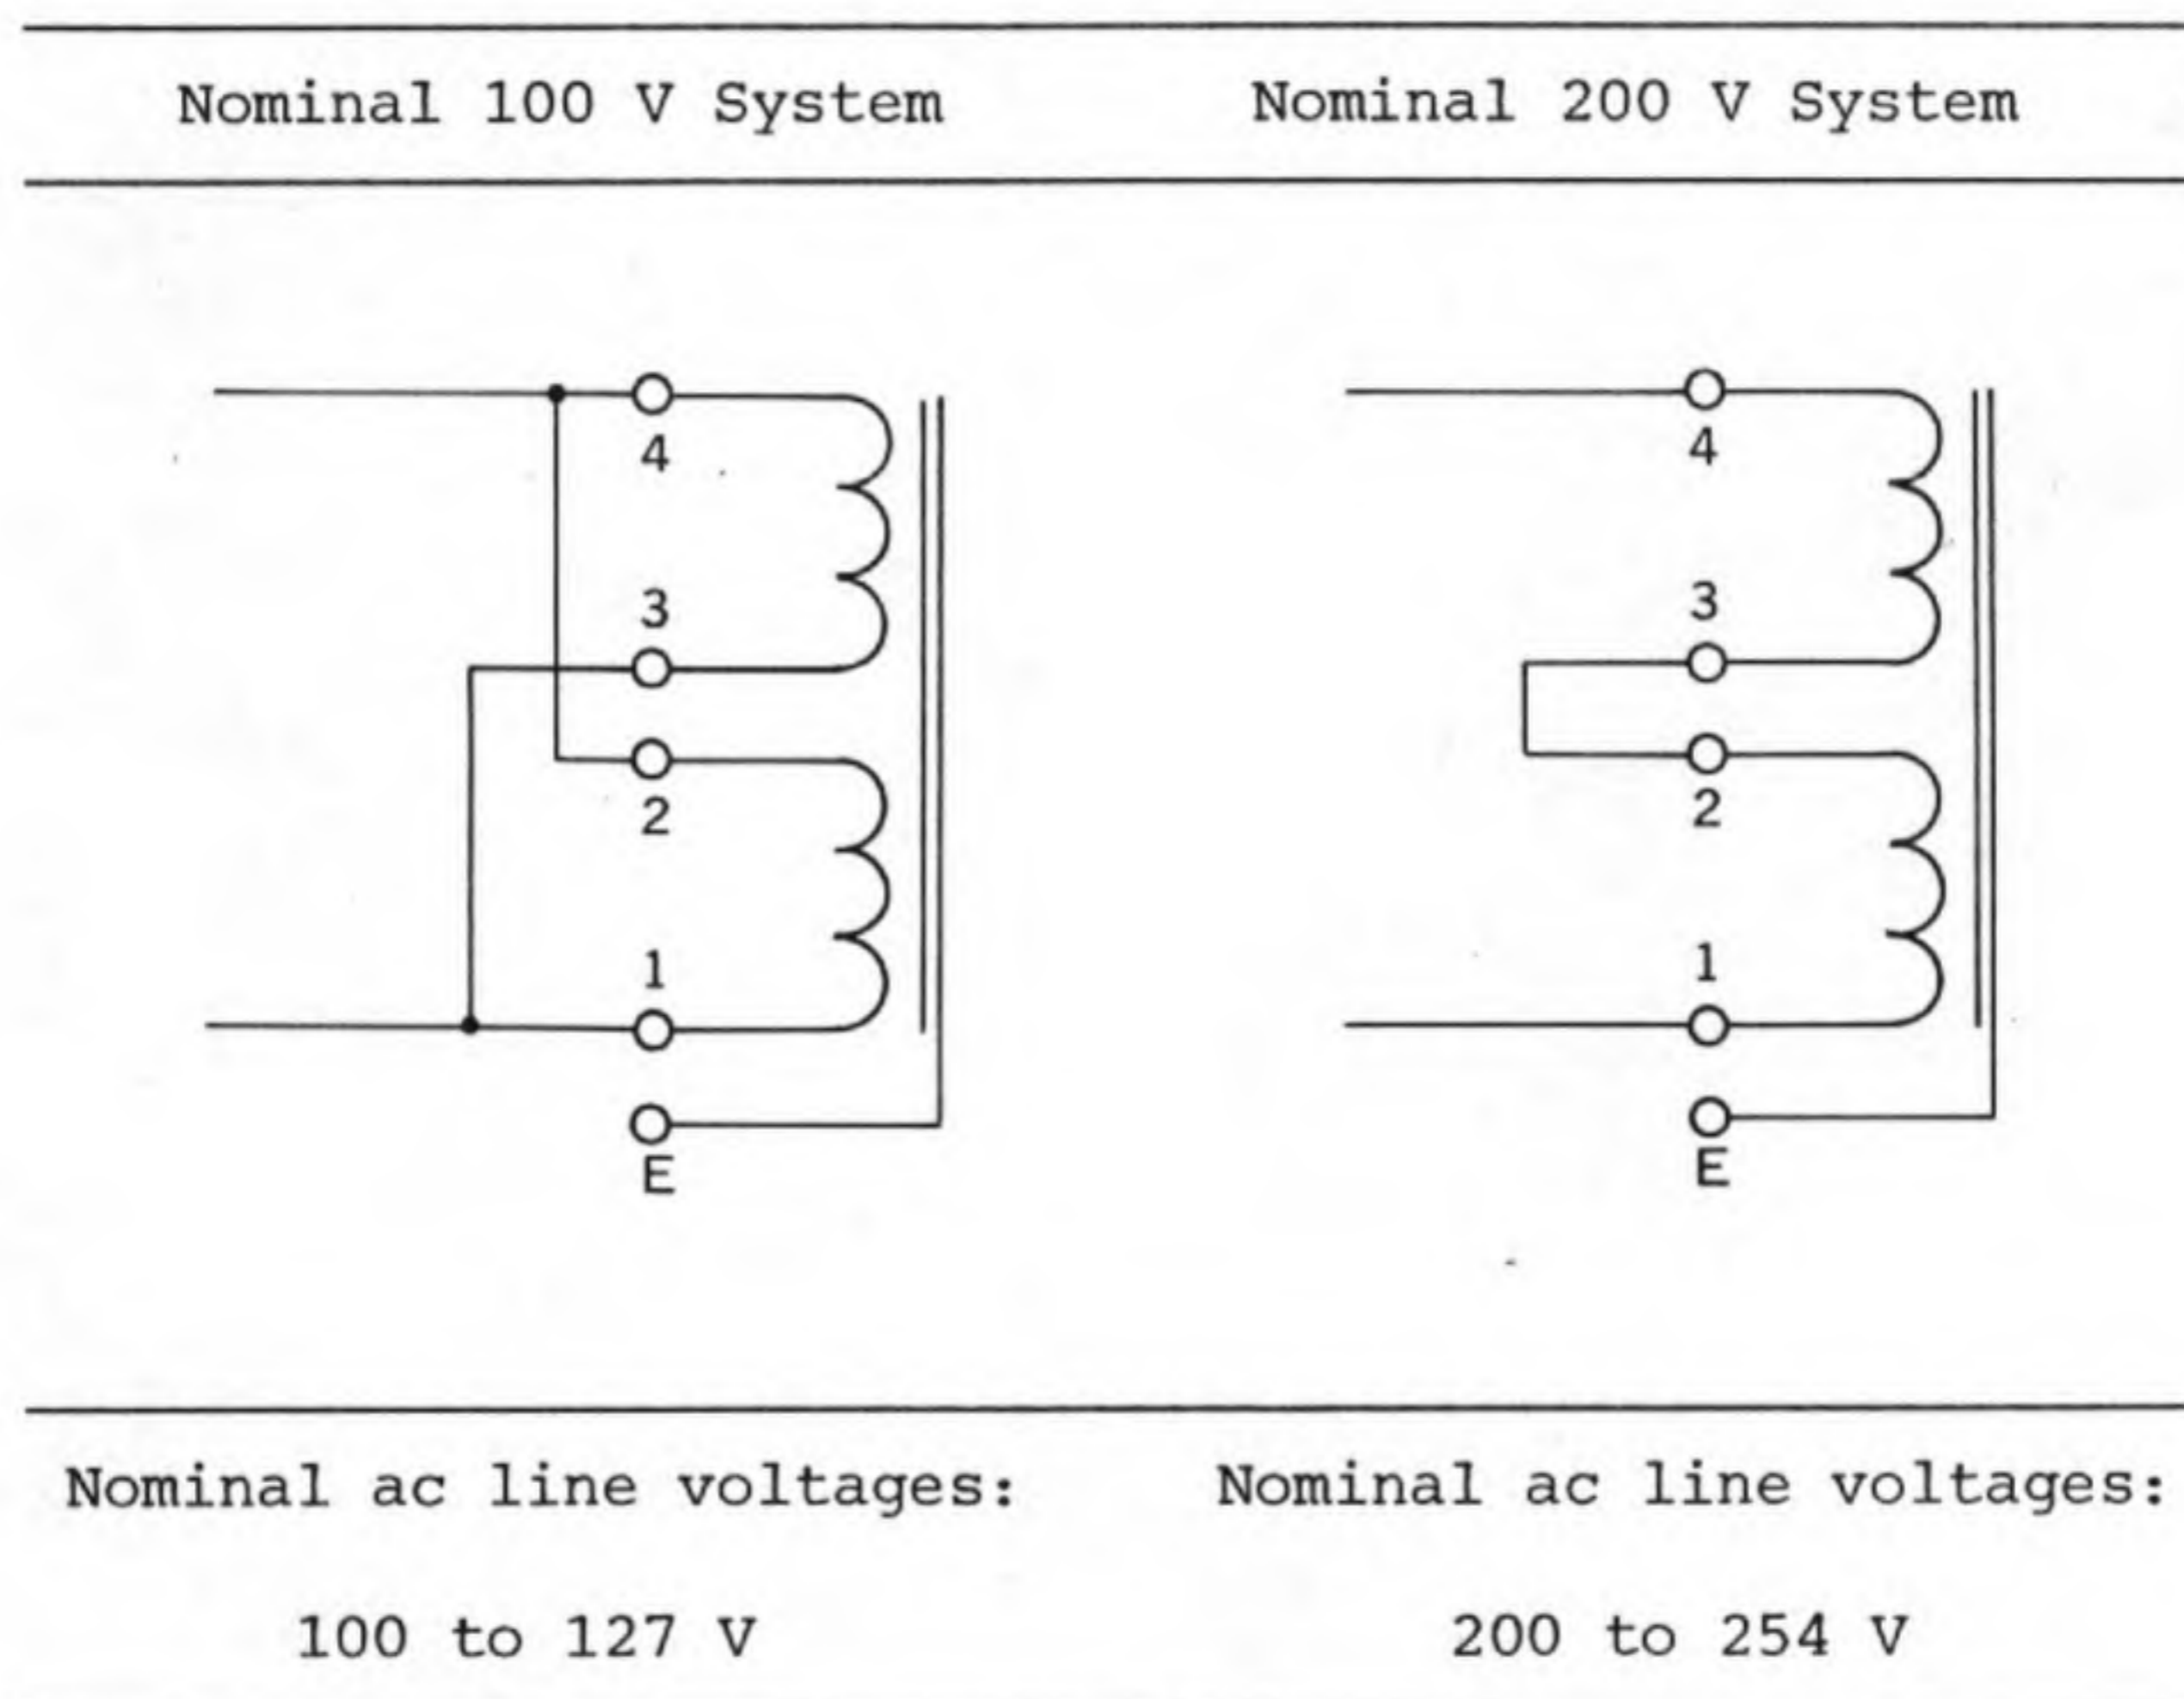

Fig. 2-12 Ac Line Power Supply Rating Change

SECTION 3
CIRCUIT DESCRIPTION

3.1 Introduction

The MS610B/J/J1 is a superheterodyne type scanning spectrum analyzer.

The block diagram is shown in Fig. 3-1.

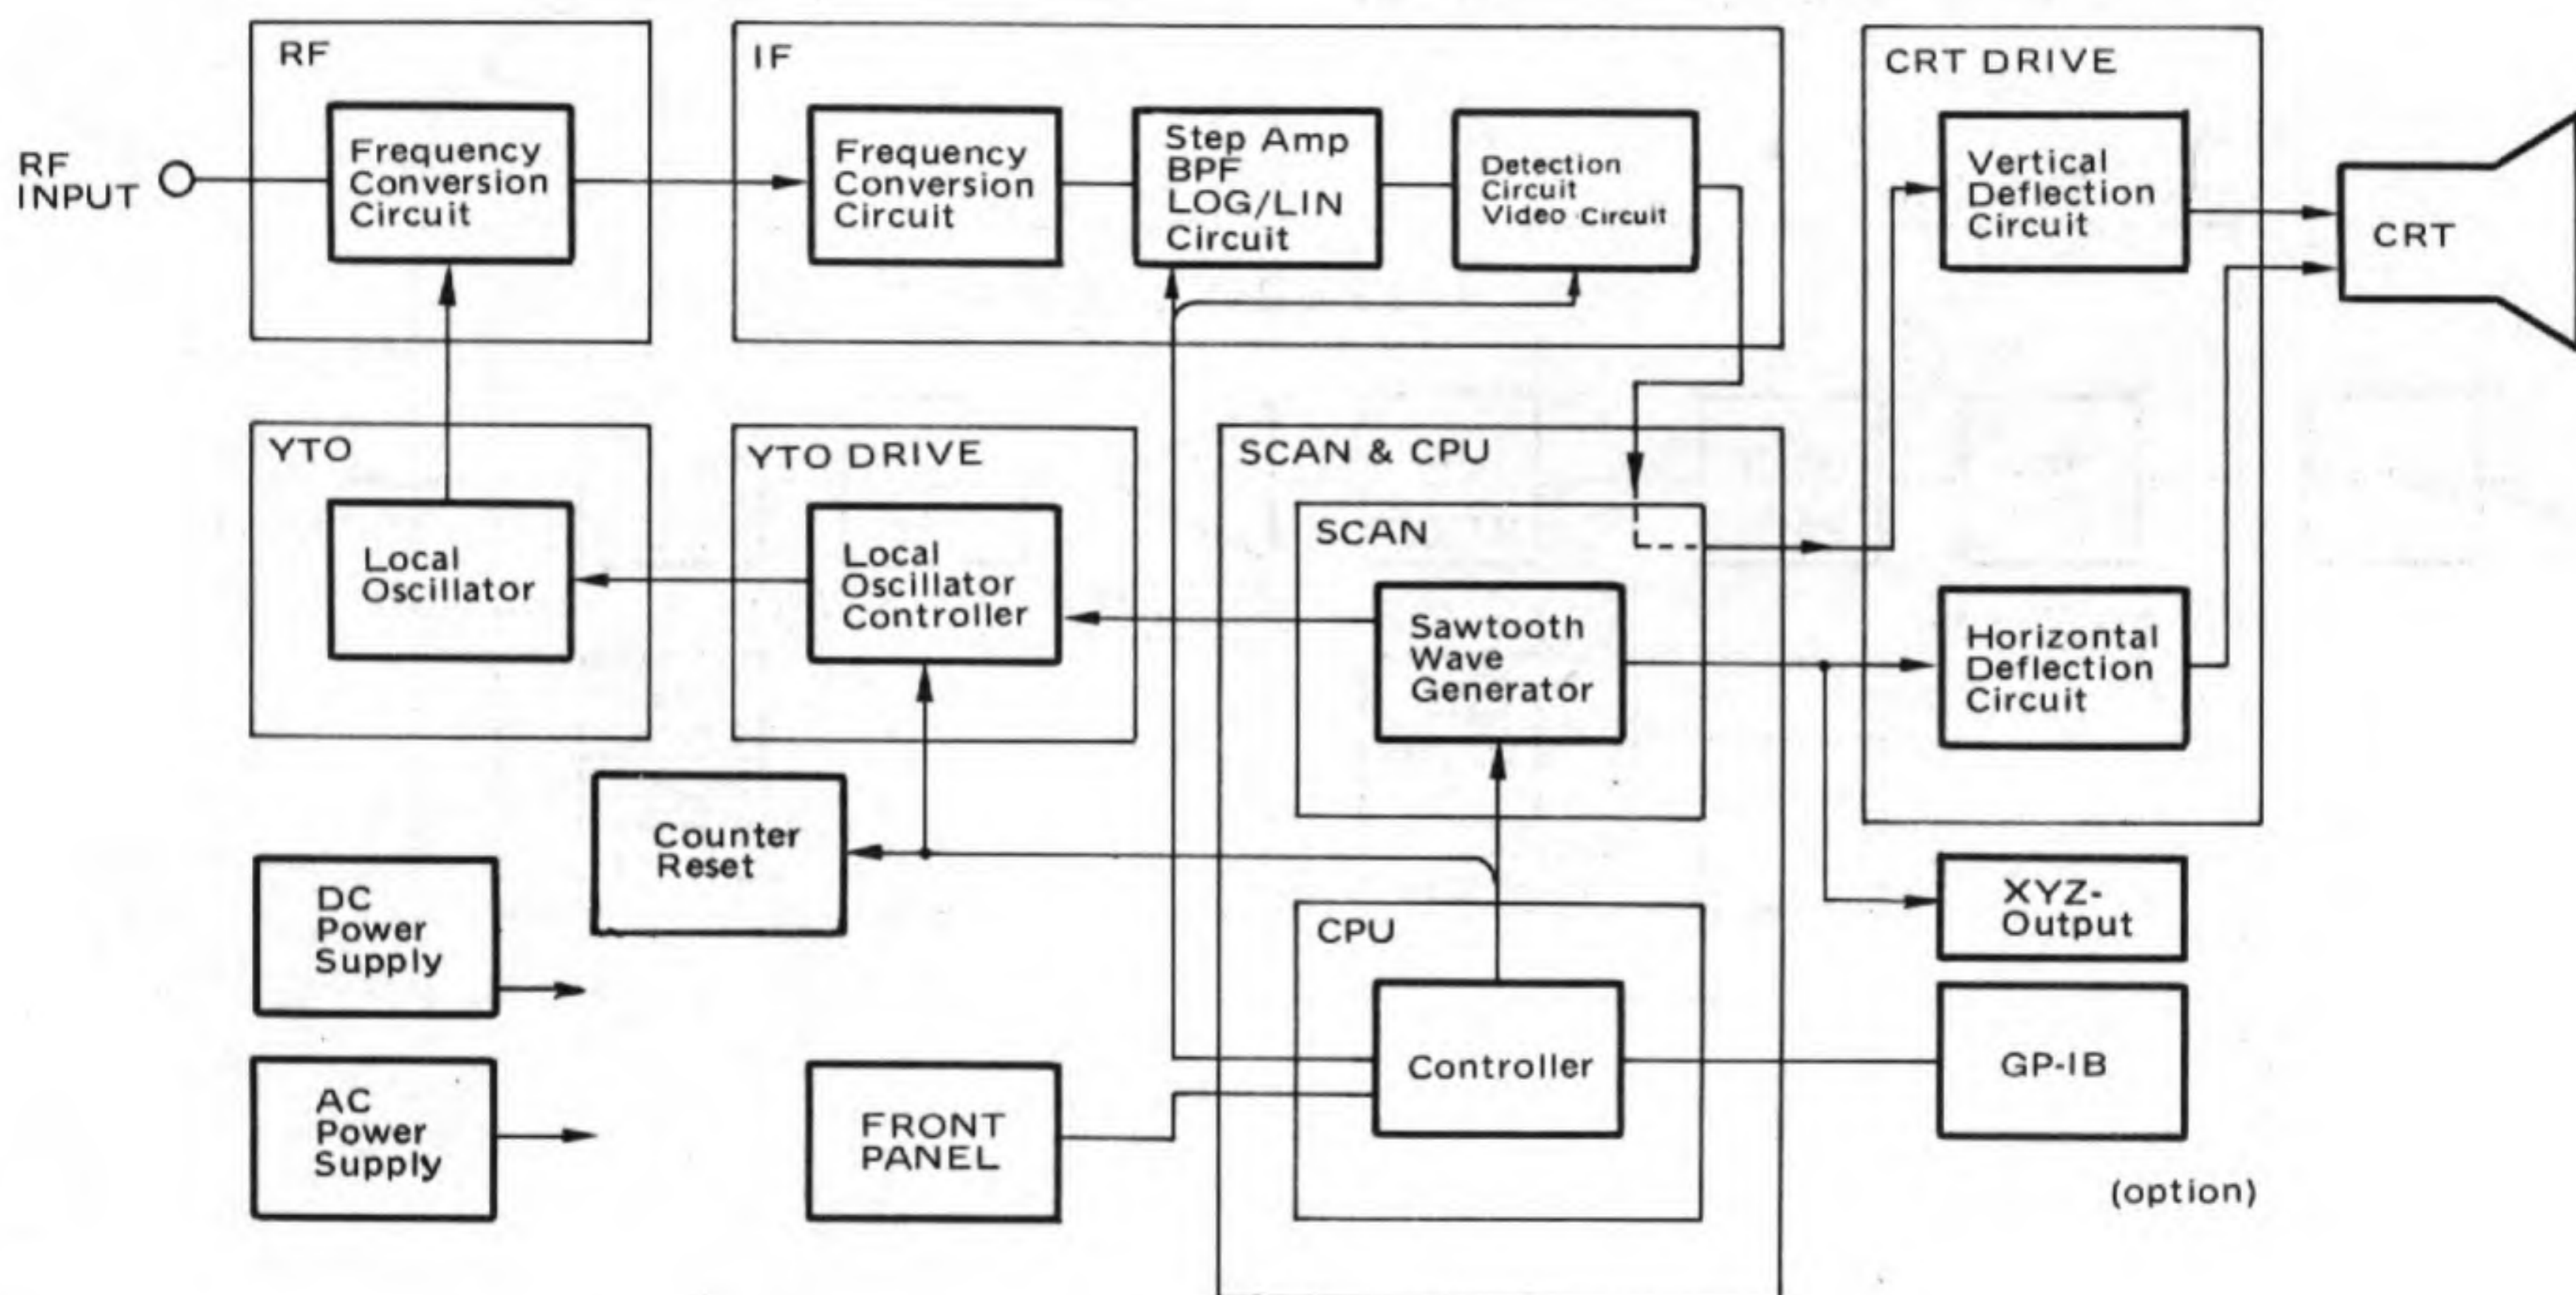

Fig. 3-1 MS610B/J/J1 Block Diagram

The RF input signal is converted to an IF signal by the frequency conversion circuit mixer in RF and IF Sections. This IF signal is detected and is applied to the CRT vertical deflection plate. The sweep signal is generated by a sawtooth wave generator and is applied to the CRT horizontal deflection plate. This sweep signal simultaneously sweeps the local oscillator, and frequency sweep corresponding to the CRT horizontal axis is performed. A controller controls each section using a microcomputer.

3.2 RF Section

After the RF input signal passes through the P-ATT (Programmable Attenuator), 0 to 2 GHz LPF and 6 dB PAD, it is sent to the Frequency Conversion Circuit. The input signal is converted to a 21.4 MHz IF signal after double frequency conversion as shown in Fig. 3-2. After the input signal is beat up to 2.5214 GHz to prevent image response, it is converted to 21.4 MHz.

The CAL signal is generated by the 50 MHz OSC.

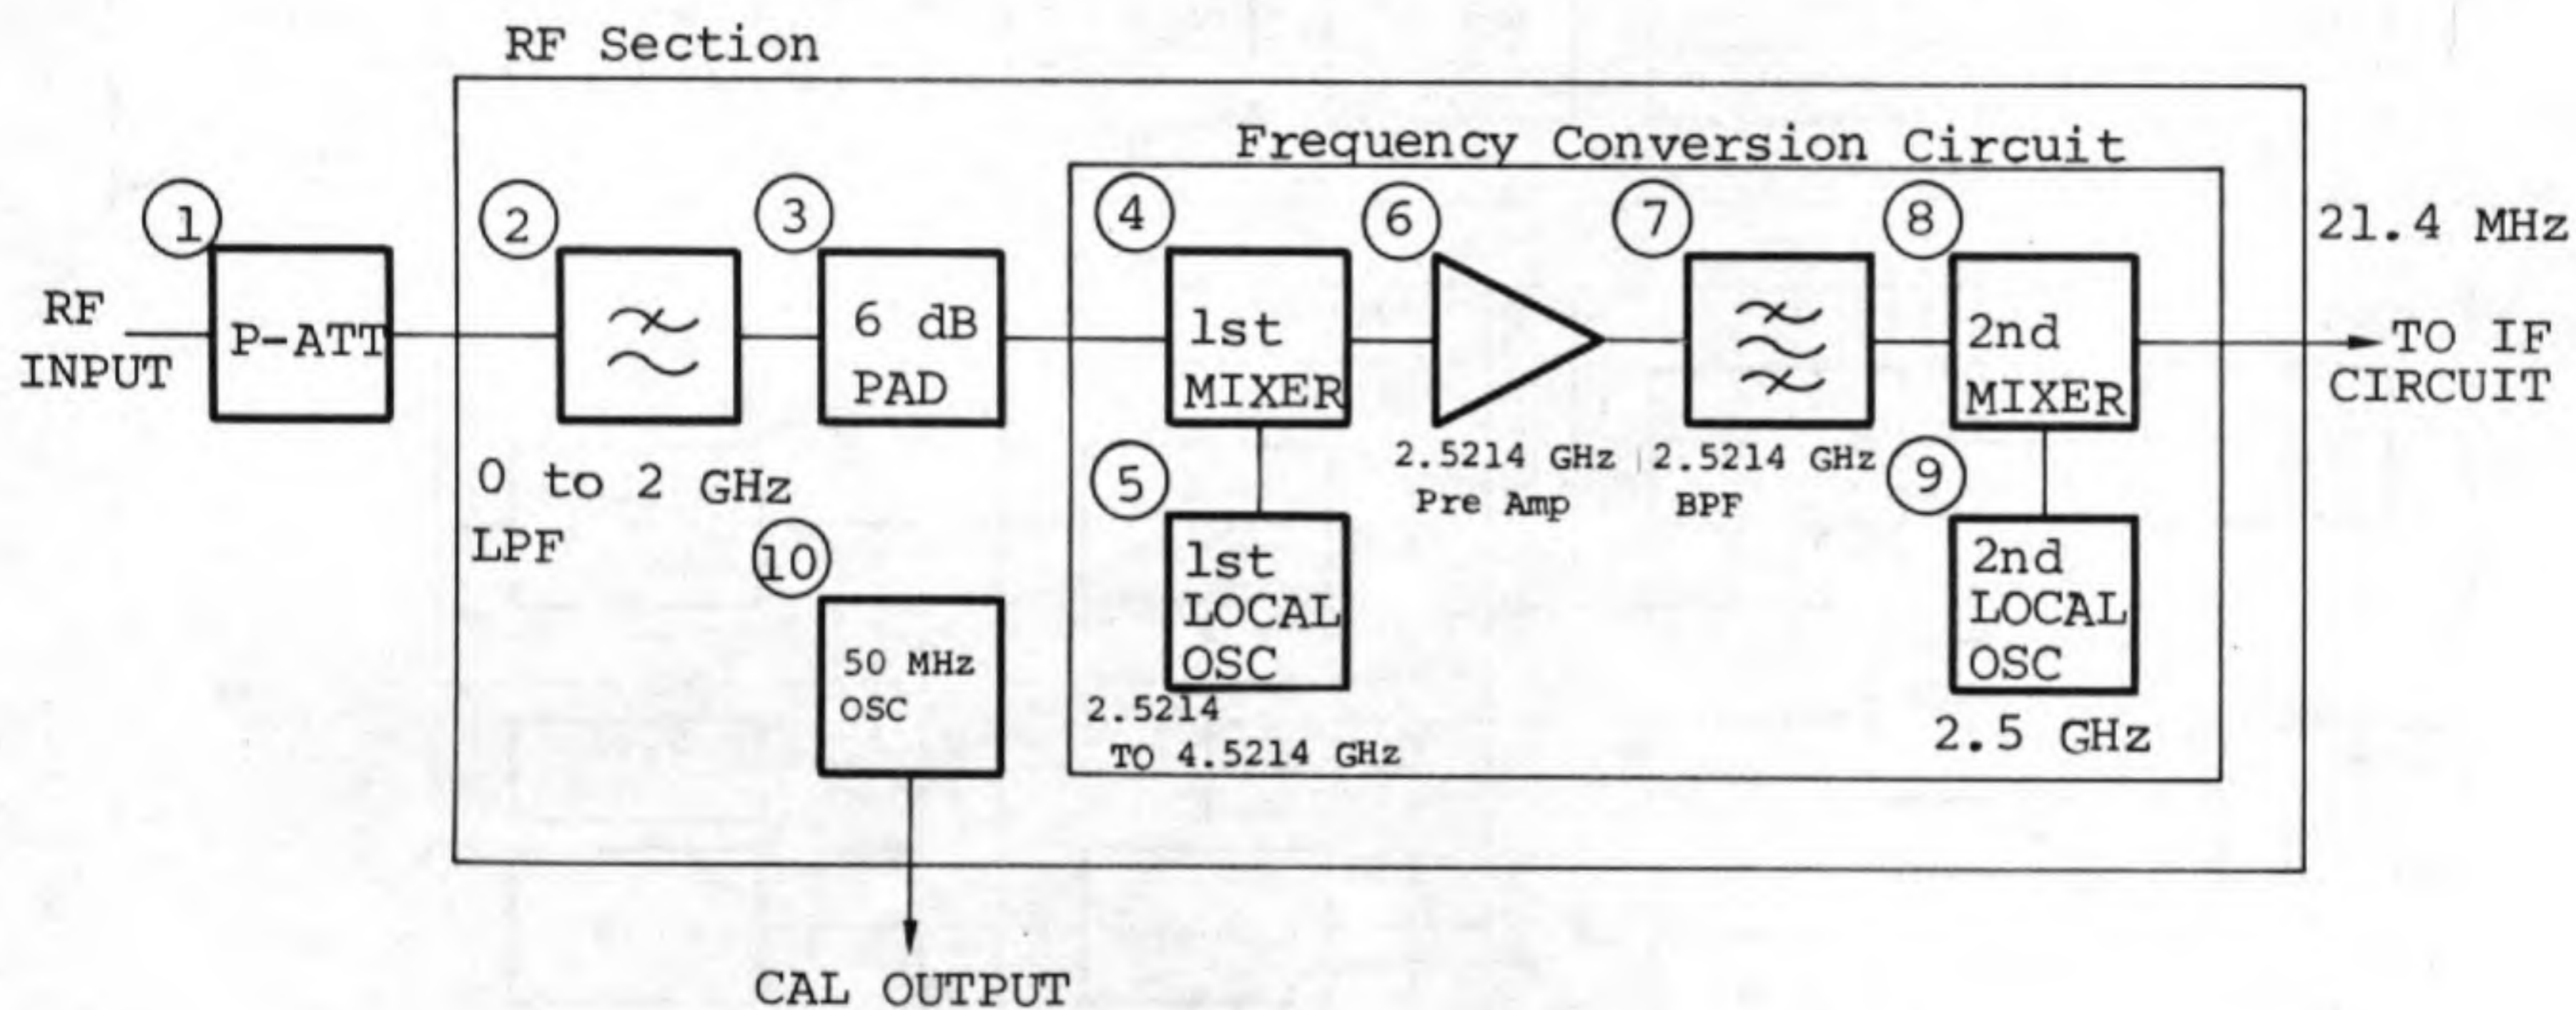

Fig. 3-2

The P-ATT is exposed in a front corner when the bottom cover is removed.

A diecast case, which includes the RF section, is exposed on the right side when the top and right side covers are removed.

The layout of the RF Section in the diecast case is shown in Fig. 3-3. The numbers in Fig. 3-3 correspond to the numbers in Fig. 3-2.

Fig. 3-3 RF Section Layout

3.3 IF Section

The IF SECTION block diagram is shown in Fig. 3-4.

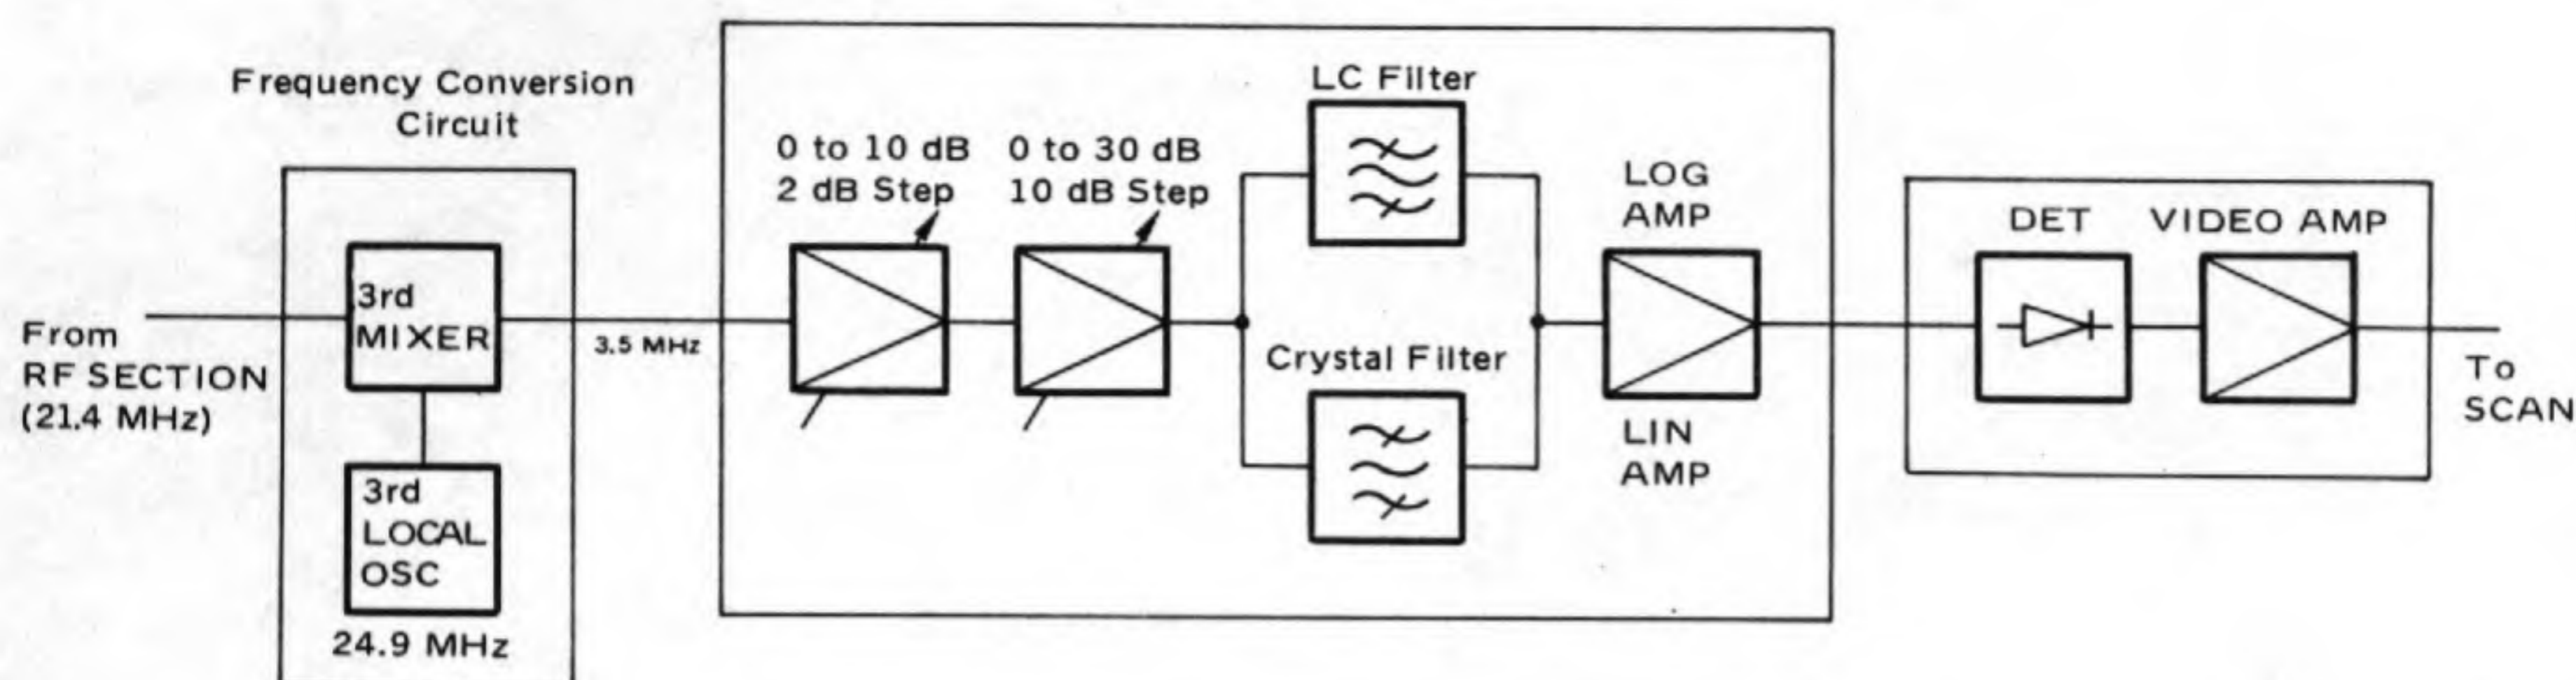

Fig. 3-4 IF Section Block Diagram

The 21.4 MHz IF signal is converted to a 3.5 MHz IF signal by a 3rd Mixer.

After the 3.5 MHz IF signal passes through a 2 dB step, 0 to 10 dB variable gain amplifier, and a 10 dB step, 0 to 30 dB variable gain amplifier, it is sent through the LC and crystal filters.

The crystal filter determines the 1 to 3 kHz bandwidth and the LC filter determines the 10 kHz to 1 MHz bandwidth. The signals from these filters are amplified by the LOG and LINEAR amplifiers which determine the vertical axis scale.

The 3.5 MHz signal from the LOG or LINEAR amplifier is detected by the detection circuit and amplified to 0 to 4 V by the video circuit.

The IF PC board is exposed when the bottom and next covers are removed.

3.4 Scan & CPU Sections

(1) Scan section

The Scan section block diagram is shown in Fig. 3-5.

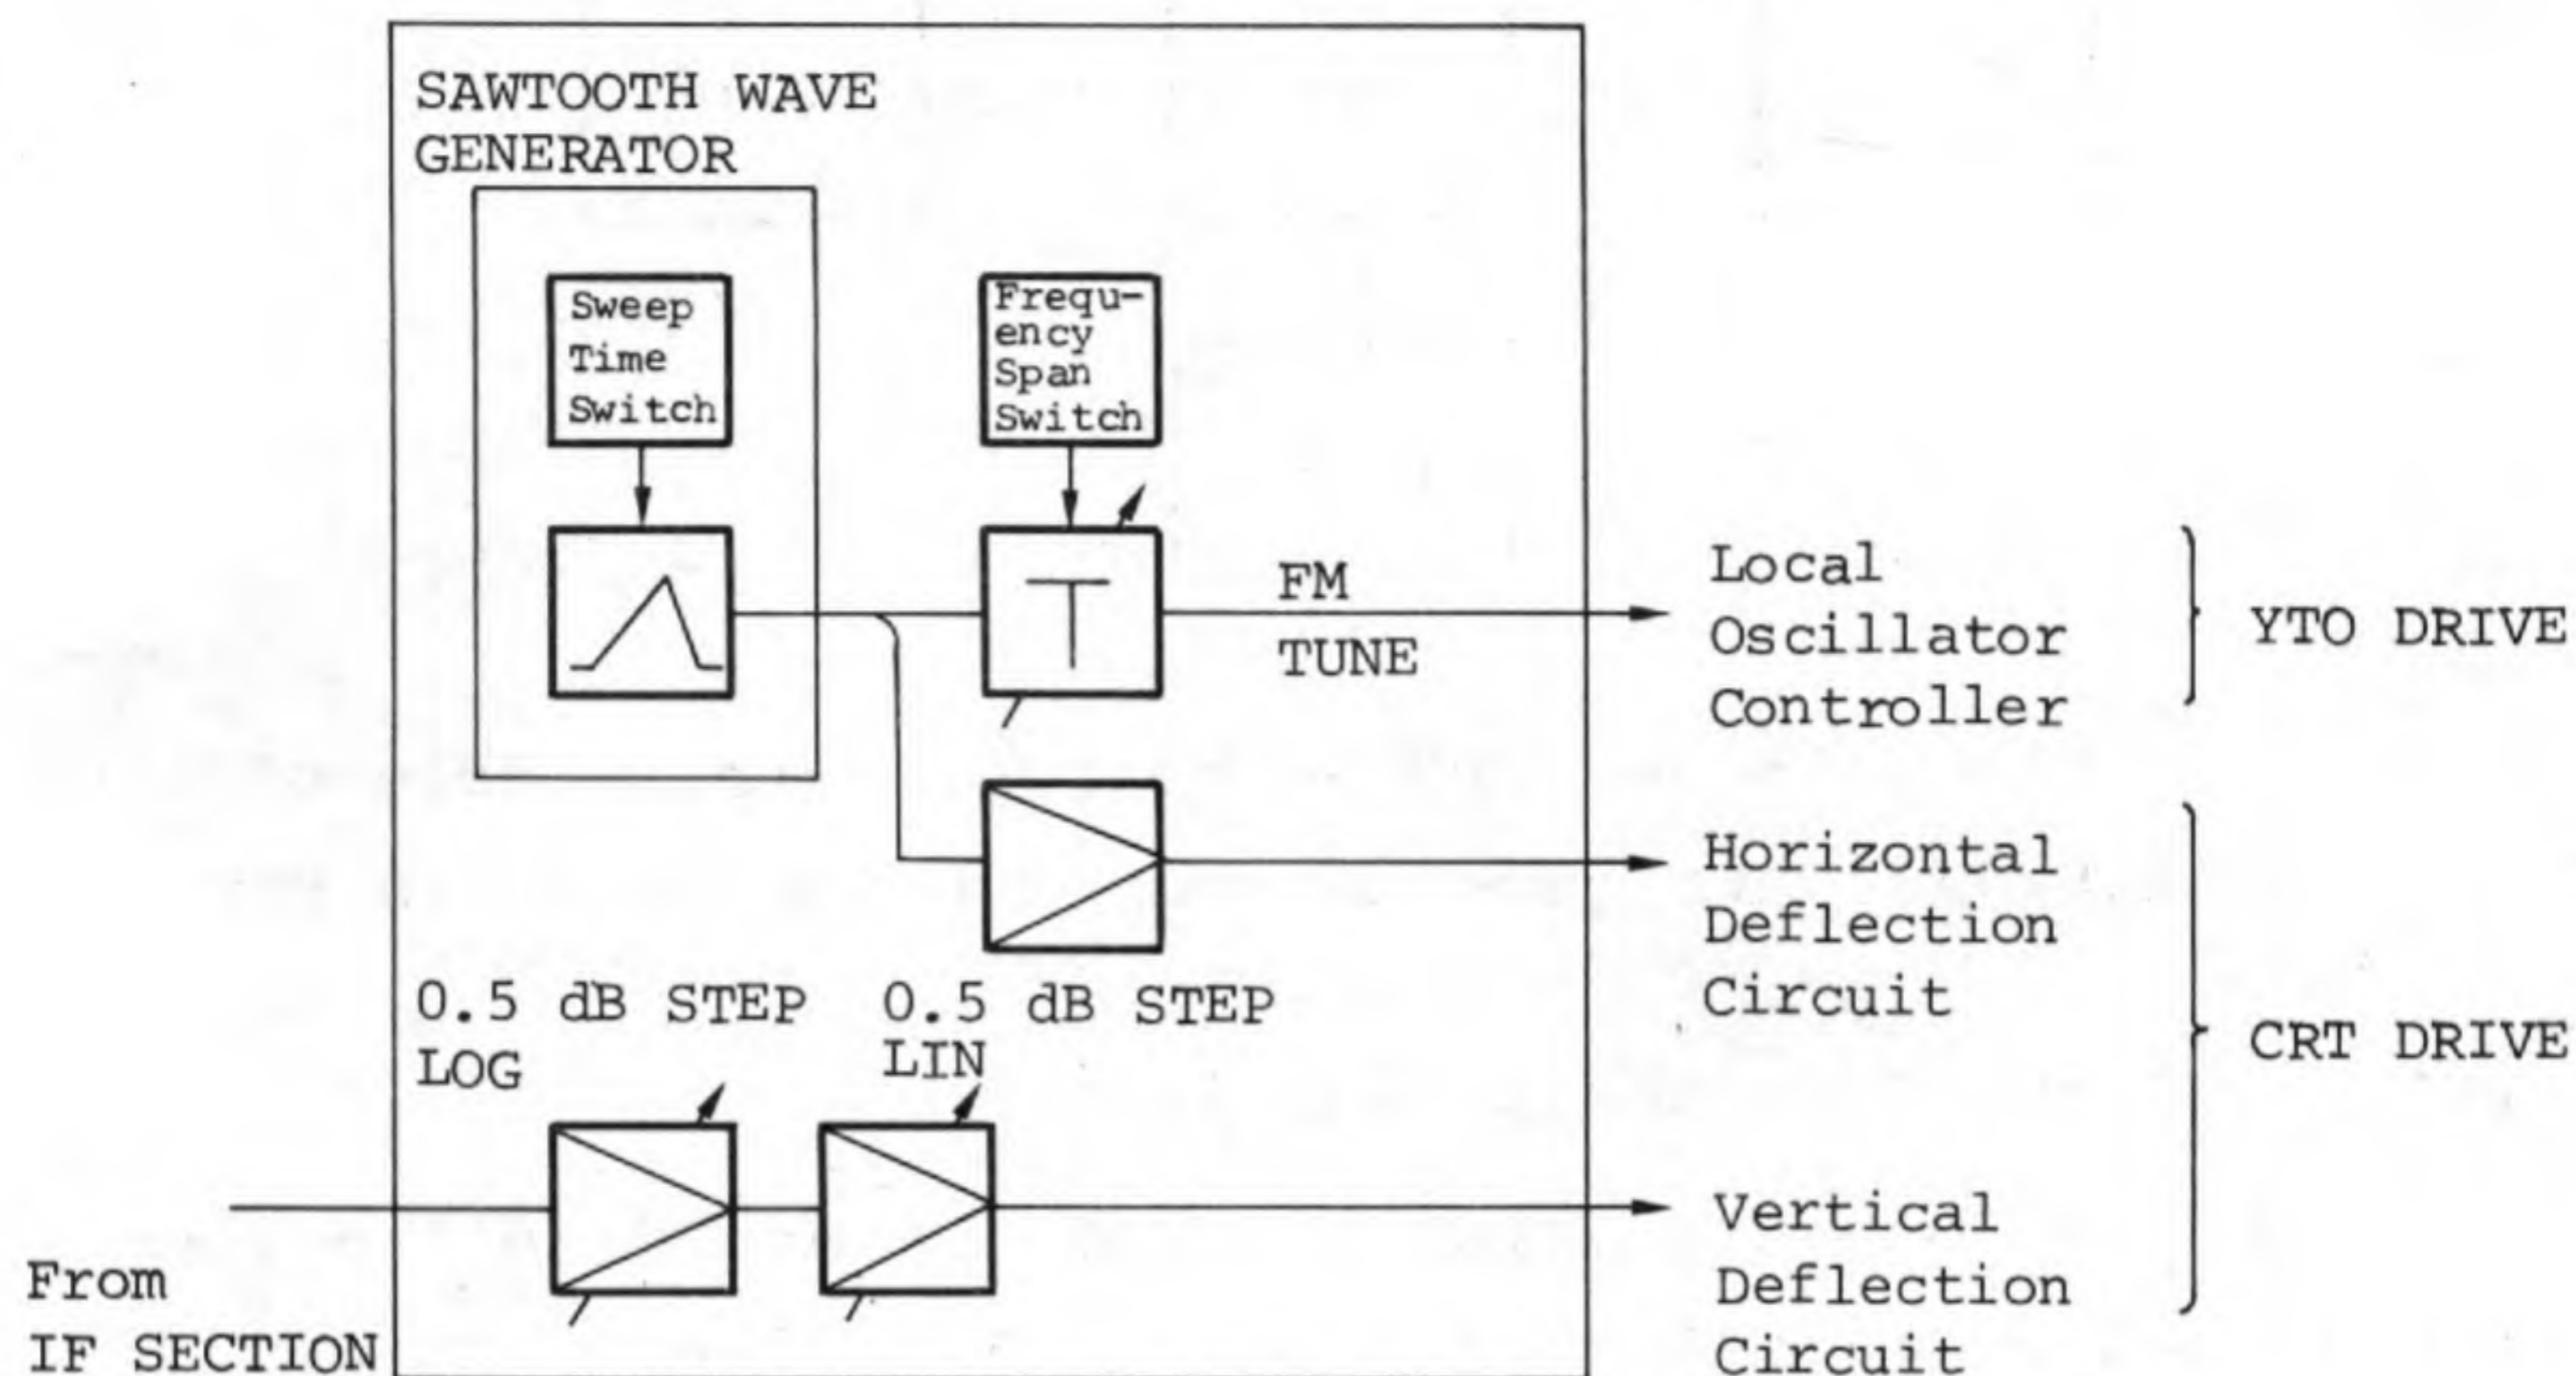

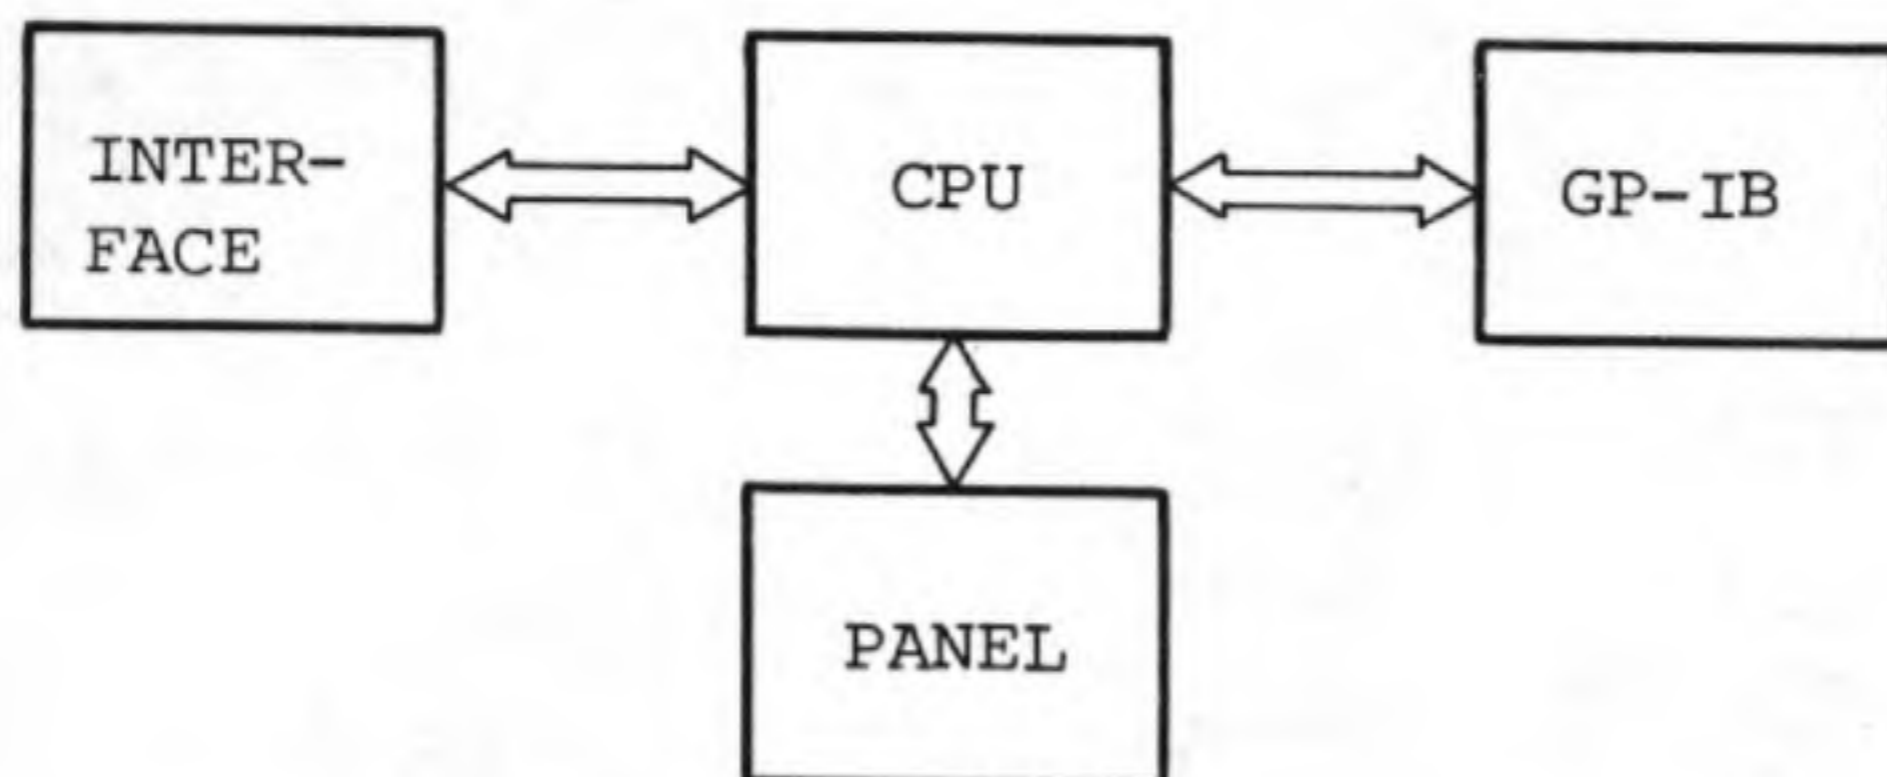

Fig. 3-5 Scan Section Block Diagram

The sweep time is determined by the SWEEP TIME switch; the sawtooth wave signal sweeps the 1st local oscillator through the FREQ SPAN switch that controls the FREQ SPAN. The SWEEP TIME switch and FREQ SPAN switch are controlled by the controller. The sawtooth wave signal also sweeps the CRT horizontal axis.

After the detected signal from the IF section passes through a 0.5 dB step Log amplifier and a 0.5 dB step Linear amplifier, it is sent to the vertical deflection circuit in the CRT DRIVE section.

(2) CPU section

The MS610B/J/J1 uses a CPU controller. Each circuit is controlled via an interface circuit for panel key inputs. GP-IB control is also performed.

The scan and CPU PC boards in the middle of the MS610B/J/J1 are exposed when the top cover is removed.

3.5 YTO DRIVE and YTO (Local Oscillator)

The YTO DRIVE section consists of an FM coil driver and a TUNE coil driver as shown in Fig. 3-6.

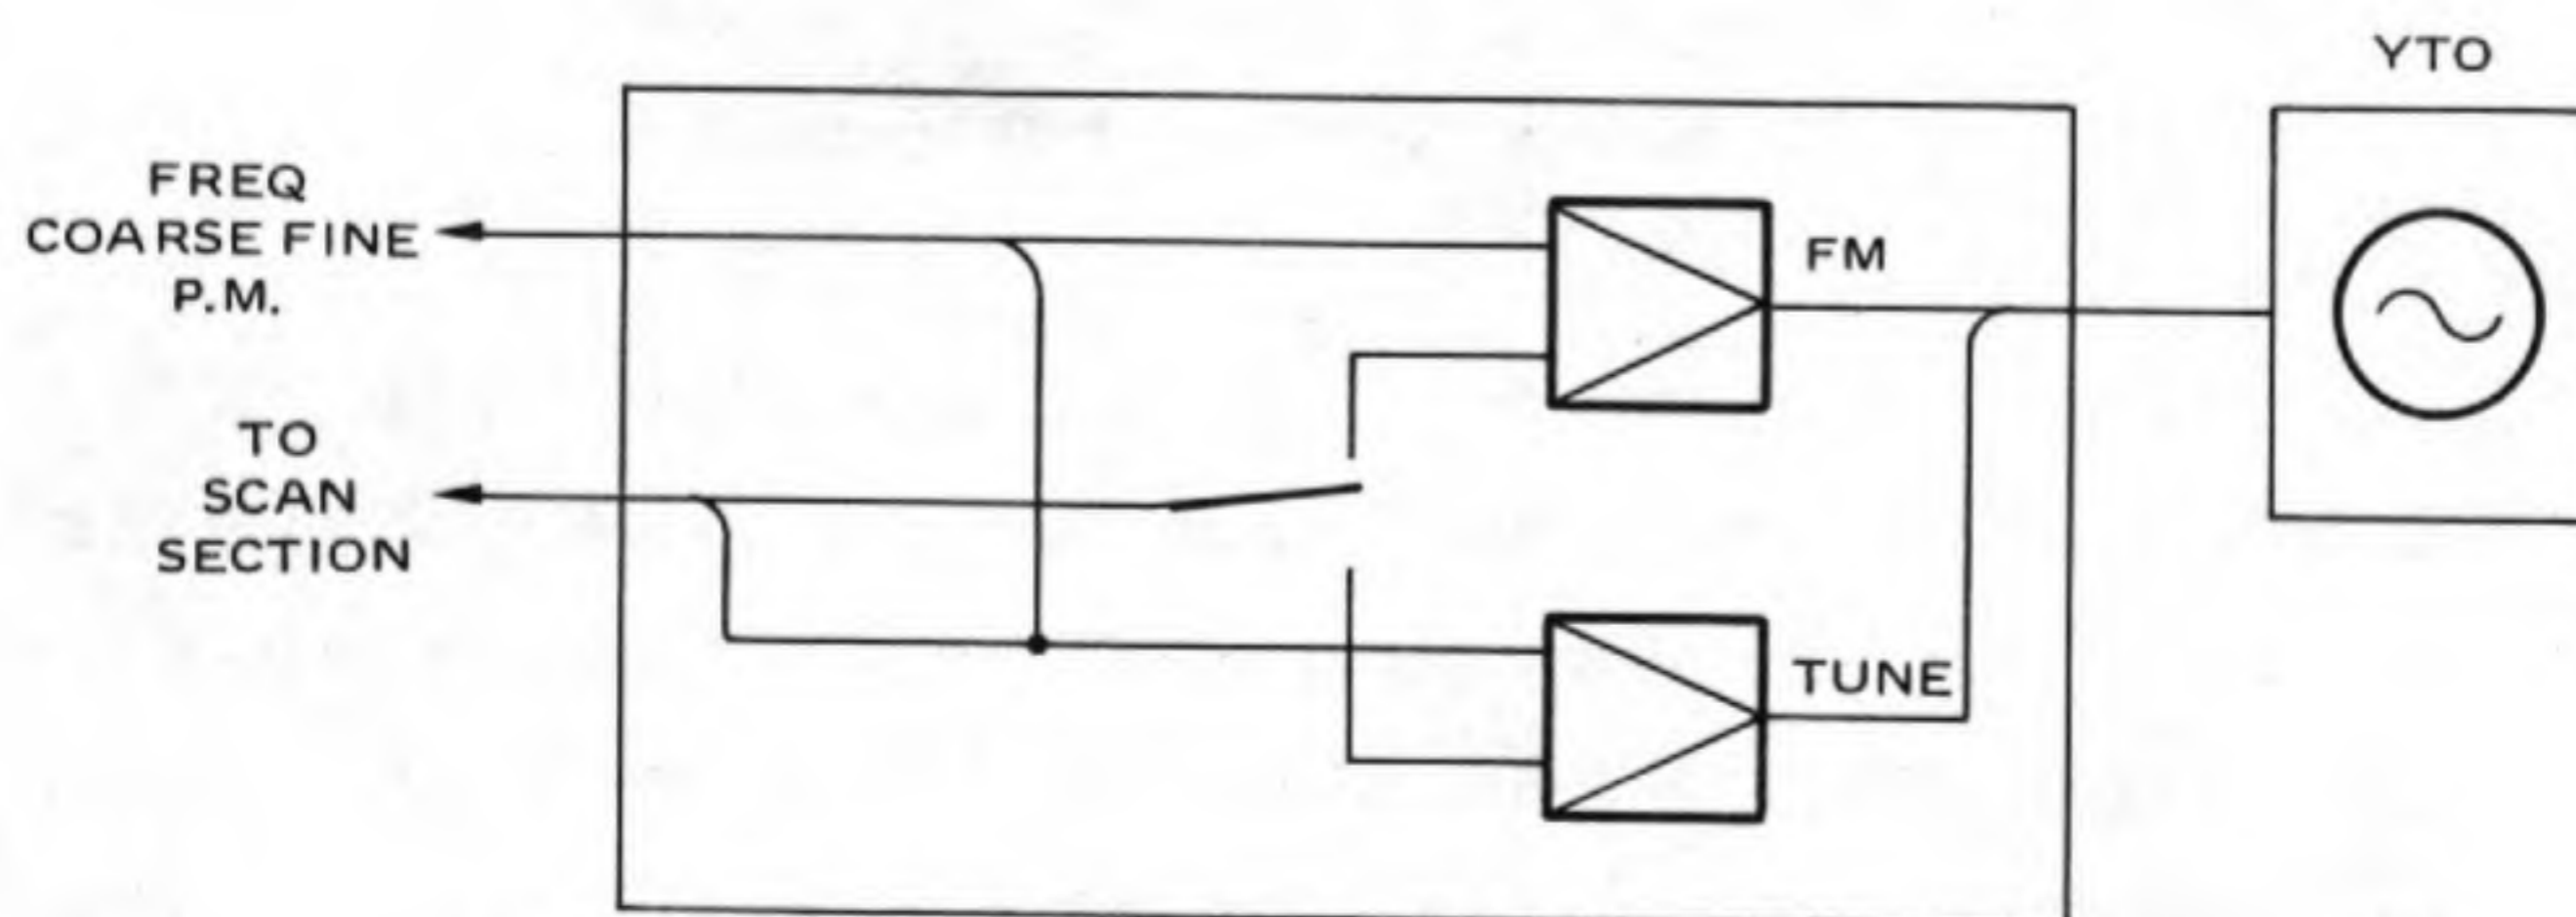

Fig. 3-6 YTO DRIVE Block Diagram

The YTO (1st Local Oscillator) contains tuning and FM coils that are driven by current.

A YTO tuned coil is used in the 5 MHz to 2 GHz wide-band sweep and a YTO FM coil is used in the 100 kHz to 2 MHz narrow-band sweep.

The YTO and YTO driver are mounted in the diecast case as shown in Fig. 3-3.

3.6 CRT DRIVE

The CRT DRIVE section receives X-, Y-, Z-axis (Blanking) and marker pulse signals from the Scan section, and intensity-controlling signal. These signals are converted to the high voltages which drive the CRT.

The PC board can be seen by removing left and protection covers.

Be careful of the high voltage.

3.7 Power Supply and Front Panel

(1) Power supply

The Power Supply section produces the dc power supply (± 15 V, ± 12 V, +5 V).

The angle (hatched) with the power supply PC board is exposed in the middle when the top cover is removed. (See Fig. 5-2.)

(2) Front panel

The front panel section drives all LEDs under control of the CPU and sends the status of front panel keys to the CPU.

The front panel PC boards are installed in front behind the displays and keys.

SECTION 4

Table 4-1 lists the names of all PC boards. It also gives the circuit diagram numbers.

SECTION 5
ADJUSTMENT

5.1 Introduction

This section describes how to adjust the test instrument, after repairs have been completed, to maintain the instrument performance within the specifications.

When two or more units are adjusted, the adjustments must be made in the sequence shown below. If this sequence is reversed, previous adjustments will be disturbed.

Step	Adjustment
1	POWER SUPPLY Z7 Adjustment
2	CRT DRIVE Z12 Adjustment
3	RF Unit: RF Conv. Z2, YTO DRIVE Z5 Adjustment
	3.1 50 MHz Osc (CAL OUTPUT) Z2-Z10 Adjustment
	3.2 2.5 GHz Osc (2nd LOCAL OUTPUT) Z2-Z8 Adjustment
	3.3 2.5214 GHz BPF Adjustment
	3.4 1st Mixer Z2-Z2, Z2 Unit Adjustment
4	IF Unit Z3 Adjustment
5	Overall Adjustment
	5.1 Horizontal Display Adjustment
	5.2 Frequency Display Adjustment
	5.3 Vertical Display Adjustment
	5.4 Overall Gain Adjustment
	5.5 XYZ Output Adjustment

Adjust only the necessary items. If correctly calibrated equipment required for adjustment is not available, do not attempt adjustment.

CAUTION

Before disassembling/reassembling the MS610B/J/J1, turn off the power switch on the front panel and disconnect the power supply cord from the ac outlet.

5.2 Internal View Under Covers

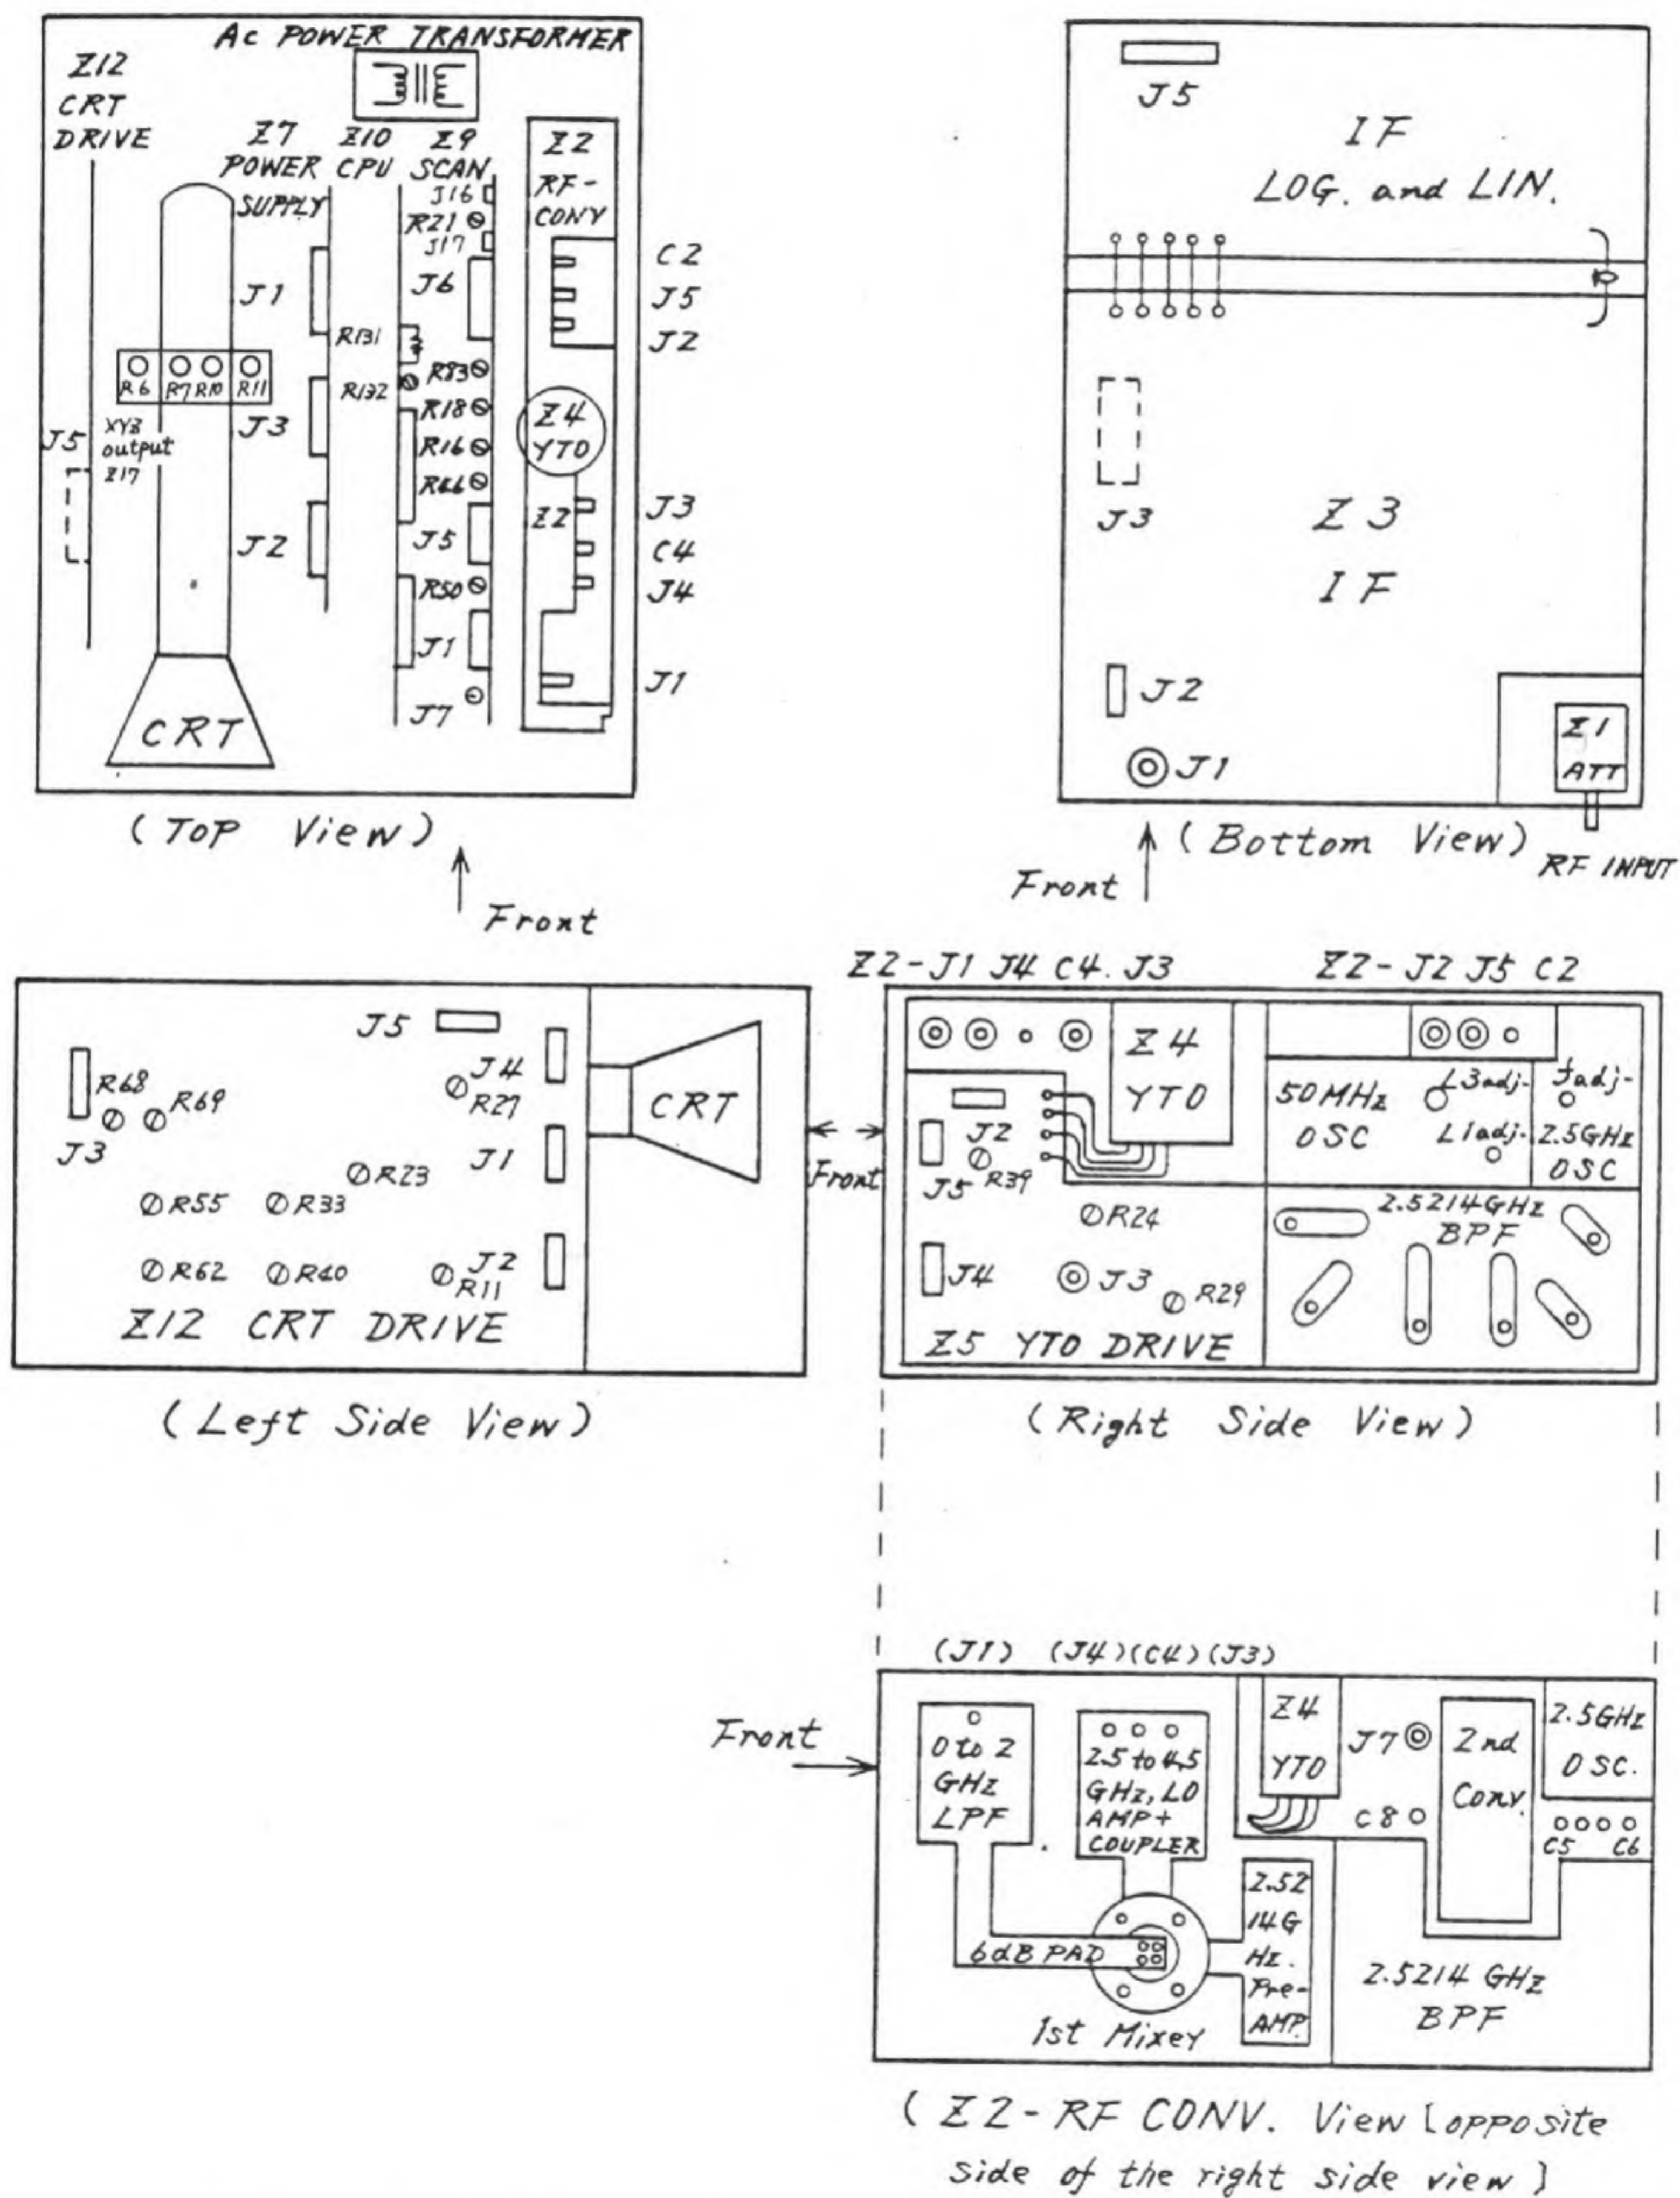

Fig. 5-1 Internal Views Under Outside Covers

5.3 Power Supply Secondary Fuse Replacement

If the dc power supply circuit is shorted to ground or overloaded, the power supply secondary fuse will blow.

Current rating of the fuses are shown below.

+15 V (+12 V)	Fuse 1	1 A
+5 V	Fuse 2	1 A
-15 V (-12 V)	Fuse 3	1 A

Replace fuses as follows:

Step	Procedure
1	Disconnect the Z7-J1, J2 and J3 connectors.
2	Loosen the two M3 screws.
3	Lift the angle (hatched in Fig. 5-2) with the Z7 POWER SUPPLY unit. The fuses are on the Z7 PC board.

SECTION 6
REPLACEABLE PARTS

6.1 Introduction

This section contains information about ordering replacement parts or components. The following tables (Tables 6-2 and 6-3) shows circuit references (hereafter: CKT REF) and abbreviations used for items in the Parts Lists. The quantity of each item in the Parts List is "one" unless a quantitative description is given in the "NOTE" column.

6.2 Ordering Information

When ordering parts, please supply the following descriptions from the PARTS LIST.

Table 6-1 Ordering Information

No.	Item	Example
1	Instrument name	MS610B Spectrum Analyzer
2	Part location	Part of MS610B/J/J1 Spectrum Analyzer
3	CKT REF	F1
4	Part name	T1A250V
Note:		
Part name is given in parentheses () in the Parts List. Parts with asterisks* require factory adjustment upon repair. When ordering part(s) marked with asterisk, give full description of the part(s).		
5	Quantity	1
6	Instrument serial no.	M31257

When ordering PC boards with parts mounted, please include the Z-number under item (2) above instead of items (3) and (4). (See Table 4-1 for PC board number.)
